

Sporophytic self-incompatibility with Class I / Class II dominance in tetraploid LEPA (Phase 5 § A.6)

A. Dominance within one plant — which alleles show up on pollen and stigma?

Case A — plant carries ≥ 1 Class I allele

Case B — plant has only Class II alleles

Genotype (4 SRK copies, tetraploid):

Expressed on pollen + stigma:

Class I dominant → only FG001 & FG002 participate in SI.
FG010 and FG015 are present in the genome but silent for SI.

No Class I present → all four Class II alleles are expressed co-dominantly and participate in SI.

Class I expressed

Class II expressed

silent (present in genome, not expressed for SI)

B. Between-plant recognition — worked example, one mother vs three candidate fathers
