

SRK structural context of allele definition — which residues can the SCR ligand actually see?

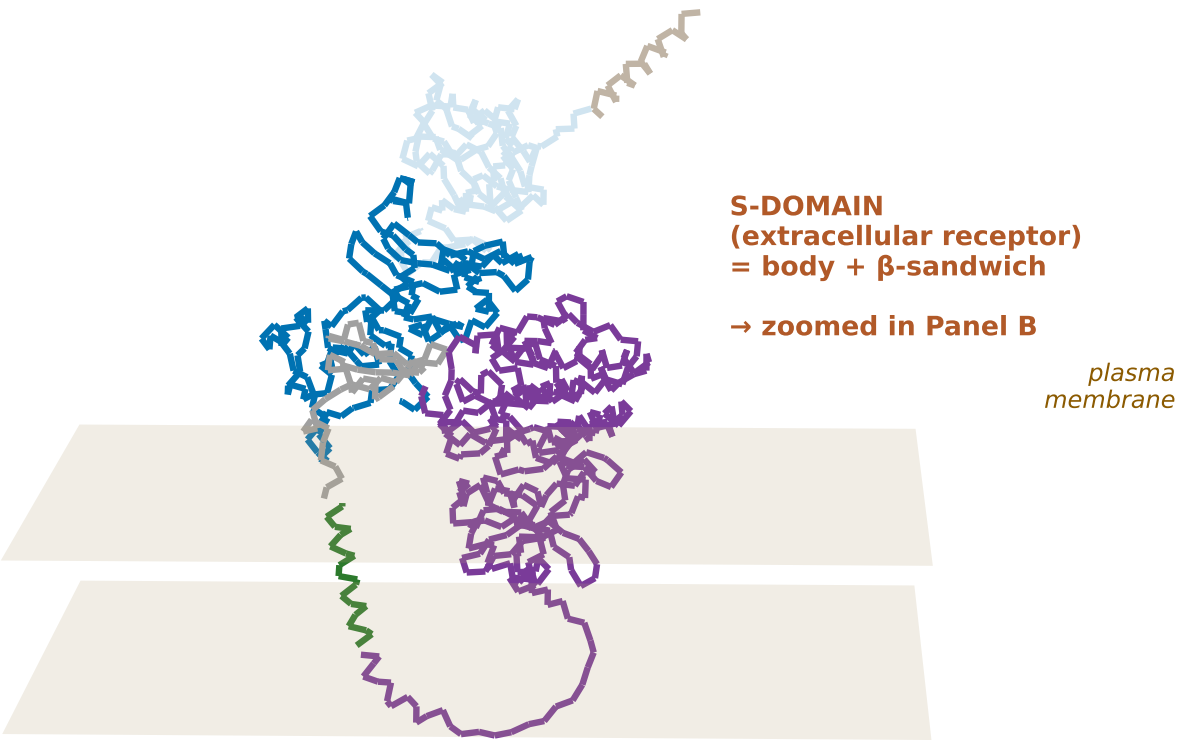

AlphaFold model | Allele_046 (FG001, LEPA subgenome-B copy g61)

A | full-length SRK (AlphaFold, Allele_046, 843 residues) — oriented as in the cell

B | full S-domain (AF 23-383) — is the body exposed to SCR?

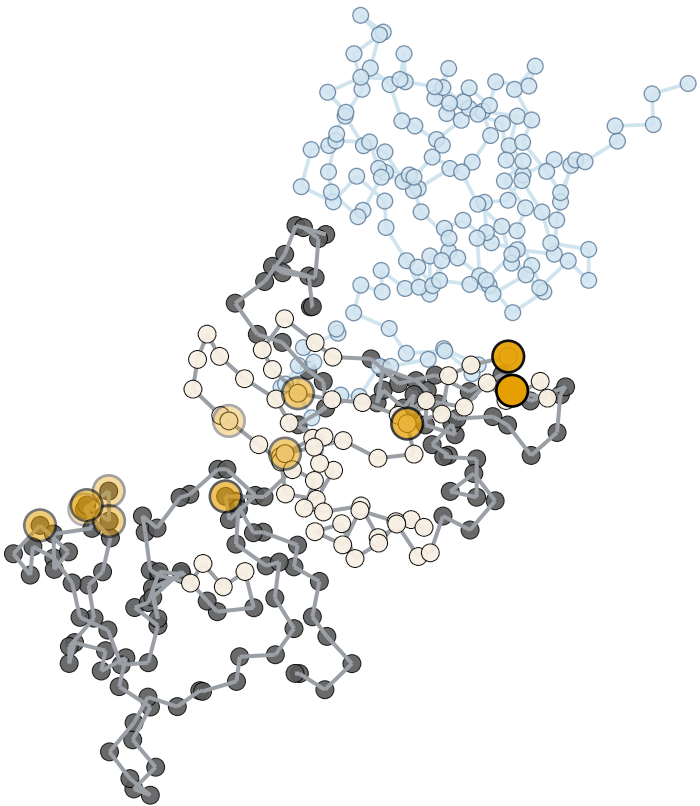

- Signal peptide (aa 1–22)
- S-DOMAIN (aa 23–383, extracellular receptor):
 - body (aa 23–176)
 - β-sandwich receptor (aa 177–383)
- Extracellular linker (aa 384–440)
- Transmembrane helix (aa 441–461)
- Kinase domain (aa 462–843)

EXTRACELLULAR

S-domain body (aa 23–176, 154 residues)
min distance to any SCR contact: median 25.3 Å | 138/154 residues > 15 Å from any SCR contact

SCR-recognition face
(HV + contact-zone side)
SCR docks here from
the extracellular space →

- S-domain body (154 res)
- β-sandwich receptor backbone (207 res)
- HV (hypervariable region, 141 res)
- contact zone (polymorphic linker, 66 res)
- SCR contact (Ma-2016 landmarks, 12 res)
