

A: unbiased truth ($N_{\text{fert_eff}} = N_{\text{fertile}} \times 50 \text{ m connectivity}$). B: sampling recovery ($4 \cdot M + 2 \cdot \text{total_seeds allele draws from the LEPA DB}$). C: coverage = $B \div A$ (dotted line = 90 % target).
 Panelled by Bottleneck Lineage in BL_ORDER. Y-label = locationCode ($N_{\text{fert_eff}}$, M_{mothers} , seeds/mother).
