

# SRK sampling overview: 367 successful samples across 16 sampled EOs of 19 catalogued

EO sizes are proportional to habitat area. Sampled populations are drawn as triangles; not-yet-sampled populations are circles. Focus EOs used in most analyses (EO18, EO25, EO27, EO67, EO70, EO76) labelled in white

Locations are not accurately represented: *Lepidium papilliferum* is federally threatened and exact coordinates are confidential. Compound germplasm sub-codes can match multiple sub-populations within an EO, so the triangle conventionally marks the largest of those candidates.
