

N_fertile_effective — the drift-relevant population size per LEPA location — 2025
A: raw census (total_n_fertile). B: N_fert_eff = total_n_fertile × largest_component_share_50m. C: connectivity share = B ÷ A (dashed line = 100 %, no fragmentation).
Panelled by Bottleneck Lineage in BL_ORDER. Same input drives Figure 3 (diversity), Figure 4 (P_compat), and Figure 5 (fecundation).
